# CATALOGUE OF DESTRUCTIVE EARTHQUAKES.

By J. MILNE, *D.Sc., F.R.S.*

---

## INTRODUCTION.

The following small Catalogue, which has taken several years to compile, is issued under the auspices of the Seismological Committee of the British Association. It represents excerpts from manuscripts and publications received from most countries in the world.

In 1888, at the end of a Report to the British Association, Robert Mallet says: "We have thus extracted all the information that our catalogue, or indeed any further cataloguing of earthquakes seems capable of giving us." Farther on he remarks, "In conclusion, I would repeat my conviction that a further expenditure of labour in earthquake catalogues of the character hitherto compiled, and alone possible from the data to have been compiled, is now a waste of scientific time and labour." To appreciate the opinion which is here so strongly expressed it is necessary to examine the catalogues to which reference is made. Although in several respects they exhibit differences, they have also strong resemblances. From the earliest historical times to the 17th century, the entries are comparatively few in number as compared with entries made subsequently. As Mallet puts it, the expanding character of catalogues has followed the progress of human knowledge, discovery, and diffusion of mankind. The records before the Christian era, and prior to the year 1700, are practically confined to occurrences in Southern Europe, China and Japan. It may, however, be noted that when Mallet wrote, records relating to the two last-mentioned countries (to which we may add India) were but few in number. In early times the entries for all countries refer for the most part to widespread disasters. References to small disturbances were never chronicled, or if they were, they have been lost. Only that which was large survived. As the material civilisation of Europe spread, new countries were settled, printing became common, and records of natural phenomena became more numerous. They however changed in character. Small events found a place in history, with the result that in the compilations referring to the last 300 years, we find megaseisms and microseisms side by side. The characteristics of catalogues to which Mr. Mallet refers are therefore as follow: First, the entries for early times, although

comparatively few in number, are fairly homogeneous in their character. Secondly, the entries for recent times are comparatively numerous but they are extremely heterogeneous. References to cataclysms are lost amid long lists of mere earth tremors. Efforts which have resulted in the creation or extension of faults and the devastation of districts stand side by side with references to "aftershocks" or slight adjustments in the settlement of strata which may not have rattled a window or awakened a sleeper.

Although much time has been expended on the analyses of these catalogues it is not surprising to find that the outcome has been more suggestive than definitive, and but little has been learned.

The present Catalogue is an attempt to give a list of earthquakes which have announced changes of geological importance in the earth's crust; movements which have probably resulted in the creation or extension of a line of fault, the vibrations accompanying which could, with proper instruments, have been recorded over a continent or the whole surface of our world. Small earthquakes have been excluded, while the number of large earthquakes both for ancient and modern times has been extended. As an illustration of exclusion, I may mention that between 1800 and 1808, which are years taken at random, I find in Mallet's catalogue 407 entries. Only 37 of these, which were accompanied by structural damage, have been retained. Other catalogues such as those of Perrey and Fuchs have been treated similarly.

The large catalogue of Count F. Montessus de Ballore, stored in the library of the Geographical Society in Paris, occupies 26 metres of bookshelves and contains about 140,000 entries. In the light of recent researches (see *Geographical Journal*, Jan. 1910) which indicate that 30,000 earthquakes may occur annually, the number of entries in the catalogue of Montessus cannot be regarded as abnormal. If the seismicity of the world has been constant during the last 1900 years, the number of earthquakes which have taken place during this period may have been 60,000,000. If we exclude small disturbances, and only consider world-shaking earthquakes, which at the present time take place at the rate of about 60 per year, these would during the same interval have numbered some 100,000. The entries in the present Catalogue are less than 6,000. Several reasons for the smallness of this number compared with what we should expect to find in a complete list, have already been indicated. To these it must be added that it has only been possible within the last few years to record disturbances originating in oceanic beds and in uninhabited regions. It is these instrumental records made during the last 10 years which have enabled me to give estimates of the total number of large earthquakes occurring in the world per annum. A list of earthquakes, each of which has been recorded over a

hemisphere or the whole world since 1898, will shortly be published as a supplement to this Catalogue.

In addition to this, I may add that during the last half century, archives previously unknown or inaccessible have become available. The *Jishin Nendaiki*, or Earthquake Calendars of Japan and Chinese histories have been translated, whilst almost every civilised country has found one or more specialists to work out its seismic history.

*Foundation of Catalogue.*—As a foundation for the present list I first made excerpts from the catalogues of Mallet, Perrey and Fuchs. This was extended from lists culled from catalogues and histories of many foreign countries, a work which involved translation from Chinese, Japanese, Russian, Icelandic and other languages. In this I received great assistance from Mr. E. H. Parker, Professor of Chinese at the University of Manchester, my assistant, Mr. Shinobu Hirota, Mr. W. A. Taylor, Mr. C. A. Gosch, Monsieur E. Scavenius, the Rev. M. S. Masó, S.J., Mr. H. Hope-Jones, Count Montessus de Ballore and other gentlemen to all of whom I now offer my sincere thanks. The back numbers of *The Times*, *Nature*, and other papers gave a certain amount of information. Lastly, I have had the advantage of a large number of lists and documents relating to earthquakes collected from various parts of the world and put at my disposal by the Foreign, Colonial and India Offices. To all these sources of information I will refer in detail. In sifting this somewhat large quantity of material, it might be suggested that the process of elimination may occasionally have been too strict. For example, small earthquakes may have been rejected which were really the surface record of shocks which were megaseismic at their origin. Inasmuch as the rejections are confined to what are clearly *aftershocks*, and to disturbances which were only *felt* at one or two places and that experience has shown that vibrations which can be felt have not travelled very far, I do not think the errors due to omission are numerous. Not only have certain small earthquakes been omitted, but whenever the information on which the accounts of large ones has been based have been of a doubtful character, these also have been rejected. For example, Mallet refers to disturbances which Barrata, the Italian seismologist, either omits or considers to be founded upon information which is unreliable. Mr. W. A. Taylor points out that the earthquakes of 843 and 846 in Naples, 950 in Syracuse, 981-995 in Sicily, 1007 or 1008 in Apulia, and 1245 in Nardo, are disturbances of a doubtful character, and are spoken of as mendacious. I have also omitted earthquakes which are said to have accompanied the birth and death of sacred personages and martyrs. At the birth and death of Christ, at the martyrdom of St. Agatha, at Calabria in A.D. 255, the day of burial of St. Agnes, A.D. 304 and at the decapitation of Sts. Valantino and Ilaria in A.D. 306 we are told great earthquakes are said to have taken place.

That great earthquakes took place in years approximating to certain of these dates there is no doubt, but we must remember that to fix a date in those early times is extremely difficult.

The Catalogue attempts to give the year, month and occasionally the hour when a large earthquake occurred; the country or district shaken; the names of the places most disturbed, the intensity of the movement and the authority from which information has been derived.

*Dates.*—The entries in this Catalogue embrace the period A.D. 7, November 10th, to A.D. 1899, December 31st. For recent times it is easy to give a date but for ancient times and in particular countries it is often difficult.

Not only has confusion arisen owing to differences in chronologies, but also owing to changes in *style* and as the early workers were probably without tables enabling them to transpose the dates of one system into that of another, mistakes have been made. It is therefore not surprising that we meet with two or more dates for the same event. In this Catalogue, in the majority of cases, the dates adopted are those found in the catalogues mentioned, but when translating new material as for example that from China and Japan, European dates have been computed. For these latter it is seldom that the hour has been mentioned. Where it is given as that of *the horse, the cow, the monkey*, or by some other animal name, this has been omitted, its reliability being doubtful. In the few cases where hours are noted they are expressed in Greenwich mean Civil Time, in which 24 hours corresponds to midnight and 12 to midday.

The dates given for China, Japan and Korea have been computed from tables published by the late William Bramsen, and lately republished in the Transactions of the Asiatic Society of Japan by the Rev. E. W. Clement who adds comparative chronological tables of the Christian Era, Japanese Eras and Emperors, Chinese Eras and Emperors and Korean Kings, with years of the Sexagenary Cycles from 660 B.C. to 1910 A.D.

Although a particular day is usually specified as the one on which an earthquake took place, it must be remembered that these may have been "foreshocks" and "aftershocks" in previous and subsequent dates.

*Names of Countries and Places.*—The names of Countries, Provinces, Departments, &c., together with political boundaries have during historical times had many changes. So far as possible the names used are those given by the authorities quoted, and correspond to names found in an English atlas. Provinces, Departments, Counties, States and Districts are given in parentheses. For example (Florence), (Campobasso), (Cosenza) indicate Provinces, while Florence, Campobasso, Cosenza indicate towns. Places which suffered most are printed in italics. In certain instances Districts, Towns or Islands, like Savoy, Nice and Malta, may appear to have the wrong country prefix. Savoy and Nice are now attached to France,

and Malta to Great Britain, but geographically they belong to Italy. Earthquakes which have been serious in two or three countries, and have originated on borderlands, may be prefixed with the name of either country. When a town has now or has had in the past more than one name, I have adopted that which is most familiar in the English language. Where I have found the name of a place or district differently spelt in three modern atlases, as for example Provinces in China, and again spelt differently by sinologues, so far as possible I have adopted that of the authority quoted. I have not adopted it in cases where the spelling might make the name of the place unrecognisable, for example a city in Japan known as Kobe is sometimes spelt by sinologues as Kaube.

For a certain number of place names in China I have adopted the spelling given to me by Prof. E. H. Parker, but for the majority of places in that country I have used that given in a geographical dictionary of the Cities and Towns of China by G. M. H. Playfair. In these we often find the suffix *Fu*. This means a prefecture or one of the largest sub-divisions of a province. In a few instances it has been difficult to identify the position of a town. For example, San José in South America may mean one out of at least 37 places. In that Continent in particular, we frequently meet with many towns and villages of the same name in a single country. Difficulties have also been occasioned in the identification of place names which during historical times have passed out of existence. To criticise my spelling is an easy matter. All I have tried to do has been to make a text intelligible. The atlases used have been Stieler, Harmsworth, Bartholomew, and Phillip's. A useful set of volumes in tracing out place names has been "The Gazetteer of the World" and its companion atlas. Localities which could not be found in these works have been referred to Mr. John Bolton, F.R.G.S., who has very kindly solved many difficulties.

*Intensity of Earthquakes.*—I have indicated the intensity of earthquakes by the Roman numerals I. II. III.

I. This means that an earthquake had an intensity sufficient to crack walls, break chimneys, to shatter old buildings or to produce slight cracks in the ground. It implies an acceleration or rapidity in the change of velocity of the surface of the ground of 1000mm. or 3ft. per sec. per sec. This means that each back and forth vibration of the ground corresponded to the jerk we should experience on a truck which commenced to move at the rate of 3ft. per sec. or when moving at that rate it was suddenly stopped. When this takes place the destructivity is usually confined to a town or village and the radius of the area effected will not exceed 5 miles.

II. With earthquakes of this intensity the acceleration is 1500mm. or 5ft. per sec. per sec., and its effect will have a radius of 20 miles. Buildings may be unroofed or shattered and

some may fall, the ground may be badly cracked in places and small landslips occur.

III. Earthquake with this intensity are those which destroyed towns and devastated districts. The ground has been faulted and fissured whilst from these openings water, mud, and sand may issue. In a hilly country landslips will be common. The acceleration may exceed 3000mm. or 10ft. per sec. per sec. Beyond the meioseismic area up to a distance of 100 miles the effects produced may be similar to those of Class I.

The origin of all these earthquakes may generally be assumed to be along the line of fault or fracture in the earth's crust. Motion sufficient to cause destruction may extend to the right and left of such a line to distances of 100 miles. With earthquakes of Class I this distance may not exceed 5 miles. Should the fault or faults run parallel to a mountain range, which is commonly the case, it is rarely that violent motion will extend beyond such a barrier. Destruction frequently takes place along the length of the valleys. In consequence of these limitations and extensions, the area violently shaken is usually elliptical in form, the major axis of an ellipse corresponding to the length of the fault or line from which the initial impulse or impulses have originated. Tele- or cryptoseismic motion which cannot be felt, but which can, with proper instruments, be recorded, does not appear to be limited by mountain barriers, but extends farther in the direction of the primary impulses or at right angles to fault lines than it does in the direction of their length. For example, the movement which caused destruction in Central California on April 18th, 1906, originated along a line of faulting 400 or more miles in length. This ran parallel to the coast of California. The most violent impulses occurred near to the centre of this line but their destructive effects were bounded on the East by the Sierras and other ranges about 150 miles distant. Very marked teleseisms however passed this barrier and extended in the direction of the initial effort round the world. The corresponding teleseismic records obtained from South America were, however, comparatively small. Notes on this subject will be found in *British Association Reports*, 1908, p. 74, and in *Nature*.

#### PRINCIPAL SOURCES OF INFORMATION.

*Mallet's Catalogues*.—The Catalogues of Mr. Robert Mallet are to be found in the *British Association Reports* for the years 1852-3-4. For each entry he gives one or more references to the sources from which he obtained his information. His first entry, 1606 B.C., which is given on the authority of Exodus, XIX., 19, and his last, 1842 Dec. 4, for which seven references are given from seven foreign publications. In the early part of his work we find many Biblical references which are intercalated with or followed by the names of ancient writers, amongst

whom we find Strabo, Herodotus, Livy, Thucydides, Justinus, Orosius, Julius Obsequens, Tacitus, Seneca, Theophanes and many others. Humboldt and V. Hoff are quoted for early and for late dates. Dom. Bouquet is often quoted. We also find references to Matthew of Westminster, the Edinburgh Encyclopædia, Bertrand, and Merian both in the "Collection Académique," The Gentleman's Magazine, Philosophical Transactions of the Royal Society, Silliman's Journal, various books of travel, the Gazette de France, Poggendorff's Annalen, Journ. des Débates, &c. At the end of his Report in 1858 he gives a catalogue of works covering 16 pp.

*Catalogues and Memoirs by M. Alexis Perrey.*—A list of Memoirs by M. Perrey, which are 59 in number, is given by Mallet in his British Association Report for 1858. In Perrey's bibliographical catalogues, published in 1855-56, there are references to 1837 different works on seismology. His earthquake catalogues published in "Mémoires de l'Académie de Dijon" and in "Bulletins de l'Académie Royale de Bruxelles" contain records from 1842-64. They are a continuation of the work of Mallet.

*Catalogues of Dr. C. W. Fuchs.*—These catalogues appear in the "Neues Jahrbuch für Mineralogie, Geologie und Palæontologie" vols. 1866 to 1872. These refer to earthquakes of 1865-1871 inclusive. In the Jahrbuch der K. K. Geologischen Reichenstalt 1873 Band XXIII to 1877 Band XXVII we find registers of earthquakes for 1872 to 1876. Catalogues by Fuchs also appear in the "Mineralogische und Petrographische Mittheilungen," Neue Folge Band I to VIII, they contain references to earthquakes 1877 Jan. 2, to Nov. 6, 1884. This work, with the exception of the years between 1870 and 1877, is a continuation of Perrey's work, but it is by no means so complete.

There are many catalogues referring to earthquakes in general prior to Mallet, but I do not know of any subsequent to these collated by Fuchs. Since 1870 however, many catalogues referring to countries or regions have been compiled.

*Italian Records.*—Mario Baratta, in his "I Terremoti d'Italia," published by Fratelli Bocca, Turin, 1901, gives in a volume of 950 pp. accounts of 1,364 earthquakes which have shaken the Italian Peninsula. The date of the first is A.D. 1 and of the last 1898. Each earthquake is discussed and in many instances small maps are given showing the area disturbed. References to authorities occupy 103 pp.

*Austrian (Central) Records.*—These have been abstracted from a "Chronologische Übersicht der Wiener Erdbeben" by P. v. Radics, see Die Erdbebenwarte 1908-1909 pp. 118-141.

*Russian Records.*—In the Memoirs of the Imperial Russian Geographical Society, vol. XXVI there is a catalogue of the earthquakes of the Russian Empire, by Mushketof and Orlof. It contains 2,574 entries. An abstract of this is given in the

British Association Report for 1910. Many of the disturbances extended into or originated in Chinese Territory.

*Chinese Records.*—These have been obtained from several sources.

1. A catalogue by Ed. Biot, published in the "Annales de Chimie et de Physique." Tome II, 1841, p. 372. It contains 480 references.

2. A translation made by Mr. Shinobu Hirota of a list of Chinese earthquakes by Professor Omori, published in Chinese idiographs in the Proceedings of the Earthquake Investigation Committee of Japan, vol. XXIX, published in Tokio. In the British Association Report for 1908 an abstract of this catalogue and that of Biot has been given by Mr. Hirota.

3. A list abstracted and translated by Professor E. H. Parker from the Tung-Hwa-Lu. This work consists of about 100 vols., to read and index which occupied Professor Parker four years. The earthquake list comprises the period 1643-1872. The English translation is to be found in the British Association Report, 1909.

4. An abstract also made by S. Hirota from a "Catalogue des Tremblements de Terre, Signalés en Chine," par le R. P. Pierre Hoang, published by La Mission Catholique in Shanghai, 1909. This is a work of 298 pp. The first entry is 1767 B.C. and the last 1896 A.D. In it the same earthquake is repeatedly entered at the different places at which it was noted. For example, an earthquake which took place on July 24 and 25, 1668, is notified at 203 places. These are found in different parts of the volume.

The information derived from these different sources, together with those obtained from the Russian catalogue, are by no means always in agreement. It is often for example difficult to decide whether the date for an earthquake refers to its time of occurrence or to the time when it was notified at some Imperial City. For this reason some of the dates given in the present catalogue are not strictly in accordance with those published in the British Association Report.

*Formosan Records.*—Records relating to Formosa have been translated and abstracted by Mr. S. Hirota from a list of Formosan earthquakes published in idiographs by Mr. Kondo and Professor Ogawa (see Publications of the Earthquake Investigation Committee of Japan, vol. LIV).

*Japanese Records.*—The entries from Japan have been obtained from the following sources:—

1. From a catalogue by Professors Sekya and Omori, Proceedings of the Earthquake Investigation Committee of Japan, vol. XLVI. This, which is in Japanese, was abstracted by Mr. Hirota.

2. A Catalogue by Professor J. Milne published in the Transactions of the Seismological Society of Japan, vol. III.

p. 65. This is a compilation made from the translations of 64 different works in Japanese characters.

3. Catalogue of Japanese Earthquakes by Dr. Edmund Naumann, Mitt. d. Deutsch. Gesellschaft f. Natur u. Volkerkunde Ostasiens, Aug. 1878.

4. Destructive Earthquakes in Japan by Dr. T. Hattori, Transactions of the Asiatic Society of Japan, vol. VI, part 2.

*Indian Records.*—A great number of these have been taken from a list given by Thos. Oldham in the Memoirs of the Geological Survey of India, vol. XIX, part 3. Other references are to be found in the Records of the Geological Survey of India, vol. XVII, part 2, vol. XVIII, parts 3 & 4, vol. XXVI, part 2. The Journal of the Asiatic Society of Bengal, vol. XLVII, part 2, pp. 131-140. Proceedings of the Asiatic Society of Bengal, March 1883, pp. 60-66.

*British Records.*—These were taken from the "East Anglian Earthquake of 1884" by R. Meldola and W. White, published by the Essex Field Club and Macmillan & Co., London, and also from an excellent catalogue by W. Roper, printed in Lancaster, 1889. His list of references occupies two pages.

*Icelandic Records.*—These were abstracted by C. A. Gosch, Esq., from "Jardskjálftar á Sudurlandi" and "Landskjálftar á Islandi," by Thorvald Thoroddsen, Copenhagen, 1899-1905. A second abstract of this work was received from the Hon. Sir Allan Johnstone, British Minister in Denmark.

*Central American Records.*—These were taken from Tremblements de Terre et Eruptions Volcaniques au Centre-Amerique par F. de Montessus de Ballore, published at Dijon, Imprimerie et Lithographie Eugene Jobard, 9 Place Darcy, 1888. Emilio Böse in his "Temblor del 14 de Avril de 1907" published by the Instituto Geologico de Mexico, 1908, gives a list of destructive earthquakes which have occurred in or near to Acapulco.

*Mexican Records.*—A full list of destructive earthquakes which have taken place in Mexico is given by D. Juan Orozco y Berra, in Memorias de la Sociedad, Cientifica "Antonio Alzate," commencing in Tomo 1, números 6 y 7, ending in número 8. His first date is 1460 and his last 1899. An abstract in the Spanish language of this work I received through the Foreign Office from His Majesty's Representative in Mexico, His Excellency Reginald T. Tower, C.V.O. From 1899 to 1909 entries are given which are not found in the original work.

*Peruvian Records.*—Through the Foreign Office I received from Lucien J. Jerome, Acting Chargé d'Affaires, a list of earthquakes which have taken place in Peru, drawn up by Mr. H. Hope-Jones, a member of the Geographical Society of Lima.

*Chilian Records.*—Through the Foreign Office and His Excellency H. C. Lowther, I received from Count F. de Montessus de Ballore a provisional list of destructive earthquakes of the Southern Andes, south of latitude 16° (S. Peru,

Chile, Bolivia, W. Argentina), see Report, British Association, 1910.

*United States Records.*—The records for the United States were chiefly collected by Prof. Harry Fielding Reid, Johns Hopkins University, Baltimore. He obtained his material from the following sources:—Holden's Catalogue of Earthquakes on the Pacific Coast, 1769 to 1897, Smithsonian Miscellaneous Collection, 1087, McAdie's Catalogue of Earthquakes on the Pacific Coast, 1897 to 1906, Smithsonian Miscellaneous Collection, part of Volume XLIX, Historical Notes on the Earthquakes of New England 1638 to 1869, William T. Brigham, Memoirs of Boston Society of Natural History, Volume II; "Note additionelle" by A. Lancaster, same; Rockwood's lists in the American Journal of Science; Dr. E. Deckert's paper on "Die Erdbebenherde, etc., von Nord-America, etc." in the "Gesellschaft für Erdkunde," Berlin, 1902; C. D. Perrine, Earthquakes in California, U.S. Geological Survey, 1895.

Prof. W. H. Hobbs, in his volume on "Earthquakes," describes certain heavy shocks.

*West Indian Records.*—Records of West Indian earthquakes have been largely taken from Government Reports printed in Jamaica, after the destructive earthquake of January 14, 1907.

*Philippine Records.*—A list of these has been published by the Rev. Miguel Saderra Masó, S.J., Assistant Director of the Weather Bureau in Manila. It contains an appendix for the Marianas Islands. The entries run from 1599 to 1909.

*East Indian Records.*—Long lists of earthquakes which have taken place in the Dutch East Indies have been published annually since the year 1865. They are by different authors and are to be found in the "Natuurkundig Tijdschrift voor Nederlandsch Indie."

*Official Documents.*—These are represented by a fairly large collection of letters, registers and other papers referring to destructive earthquakes in various parts of the world. They were brought together by the Foreign, Colonial, and India Offices, with the assistance of representatives of His Majesty's Government in Foreign Countries, Colonies and Indian Empire.

It is not for one moment supposed that this Catalogue is free from omissions and mistakes. Should a reader notice them I trust he will give me an opportunity of rectifying the same either in the appendix now in preparation or in some future publication.

JOHN MILNE.

I, II, III See p. 653.

Departments, Provinces, Counties, Districts are in parenthesis. Localities most severely shaken in Italics.

CATALOGUE OF DESTRUCTIVE EARTHQUAKES.

A.D.		
7	Nov. 10	China (Shensi), The Imperial City Changan, now Hsian and the northern district III H.
15		Italy, Rome II B.
17		Asia Minor III M.
18	Mar. 18	Italy, Reggio (Calabria), Sicily II B.
20		Italy, Rome I B.
25		Italy, Rome I B.
27		Italy, Rome I B.
33		Asia Minor, Bithynia and Palestine I M.
46	Oct. 23	China, Earthquake in forty-two counties, Nanyang (Honan) III H.
63		Italy, <i>Pompeii</i> , <i>Herculaneum</i> , Naples and other places in (Campania) III B.
68 or 69		Italy, Chietino in the (Abruzzi) II B.
77 or 78		Island of Cyprus III M.
79	Nov. 23	Italy (Campania), associated with the great eruption of Vesuvius which buried Pompeii I B.
85		Italy, Rome I B.
94		Italy, Rome II B.
103		England (Somersetshire) I M. & W.
109 or 110		Asia Minor, Galatia III M.
116		Italy, Rome II B.
119	Mar. 11	China (Honan), The Imperial City Loyang, Honan Fu. It was felt over forty-two counties III H.
121	Oct. 10	China, thirty-five counties were shaken and towns damaged III H.
128	Feb. 23	China (Kansu), The Imperial City and Hanyang, now Fuchiang, Kungchang Fu III H.
132		West of Scotland I M. & W.
138	Mar. 1	China (Kansu), Imperial City and Chinching in Lanchou Fu, Lungshi in Kungchang Fu III H.
144	Feb.	China (Kansu), Liangchou Fu, and six neighbouring districts III H.
177		Italy, Sicily III B.
180	Jan.	China (Kansu), Chiuchuan in Kanhou Fu III H.
204		England (Brecknockshire) I M. & W.
